SUMMARY

BACKGROUND & RESEARCH OBJECTIVES

In Thailand, transgender women are biological males who act, feel, think and look like females. Thai society is generally more accepting of transgenders than in the norm in other countries, and the majority of transgenders openly live their lives as 'women'. Some transgender women however face discrimination and stigma within their families or working life, with a significant population of this population of transgender women being involved in commercial sex work¹. The situation of stigma and discrimination in the lives of transgender women in Pattaya is strongly linked to their vulnerability to HIV. For instance, violence and threats of violence may limit the ability to negotiate safe sexual behaviors, and then may also increase the chance of non-protective sex.² Transgenders are not allowed to enter some hotels in Pattaya. Most of them live separately from their families, although, in most cases, their close family members will be aware that they are living as a transgender. In the past, carrying condoms while looking for client along the street made them afraid of getting arrested, although this is no longer a major concern for most transgender women in the study area.

Previous studies conducted by PSI have indicated multiple sex partners and inconsistent condom use during sex among transgender women. There is a high prevalence of HIV risk behavior and it is suspected that HIV rates are higher among transgender women than among the more general MSM population in Thailand. HIV prevalence among transgender women (TG) in Chonburi is 8.85 percent.³

In 2011, TG TRaC baseline study was conducted with 386 TGs in Pattaya, Sattahip and Sriracha. This study focused on four key behaviors; condom use, lubricant use, VCT and STI screening. TG reported high percentage of condom use at last sex. Consistent condom used with all type of partner was lower than condom use at last sex. Condom use behaviour varies by partner type. With commercial partner and regular commercial partner, TG reported more consistent condom use than with casual and regular partner. Two-thirds of TG (66.6%) reported ever having been tested for HIV, while 50.3% of them received the test in the past 6 months. Factors that associated with condom use are availability of condoms, attitudes, intention to use condom and self-efficacy.

The purpose of the Tracking Results Continuously (TRaC) survey among Transgenders (TG) is to provide evidence for monitoring and implementation of PSI/Thailand's HIV prevention program. Information from this study will be used to develop behavior change communication interventions for HIV prevention including branding, key messages, and/or campaigns for condom use, lubricant use, HCT and STI testing

This study is the second round of the TRaC Survey. This survey aims to answer two fundamental questions related to monitoring and evaluation.

1. Monitoring. What are the levels and trends are evident in other key behavior, risk, OAM constructs, and exposure to PSI/Thailand activities?

¹ Thailand (2009): HIV/AIDS TRaC among Transgenders, Third Round

² The operational research on developing healthcare and social service system for TG and MSW in Pattaya affected by manifestations of stigma and discrimination, including gender-based violence, Policy Research and Development Institute Foundation.

³ IBBS, Chonburi Provincial Public Health Office, 2010

2. Evaluation. Is exposure to PSI/Thailand activities leading to changes in OAM, risk, and behavior?

DESCRIPTION OF INTERVENTION

PSI/Thailand is implementing a program “Sisters”, the Targeted Behavior Change Communication (BCC) Program for HIV/AIDS Prevention among Transgender Population in Pattaya, Chonburi Province, Thailand. Programmatic focus is placed on behaviors and high transmission sites, or “hot spots” that are identified as the principal drivers of HIV in Thailand.

The purpose of the program is to promote safer sex among TG through peer education and drop in center activities in Pattaya (Sisters), and using a high coverage social marketing (SM) strategy to increase access to and availability of condom and water-based lubricant. Peer education activities will expand to Sattahip and Sriracha District in Chonburi Province. Activities in the drop in center include designing and implementing culturally appropriate behavior change programs through interpersonal communication, ensuring access to high-quality voluntary counseling and testing services, developing the capacity of most at risk populations to lead prevention activities, creating safe spaces for most at risk populations, enhancing access to essential care and treatment services for HIV/AIDS, monitoring and evaluation of all activities and documenting lesson learned. Outreach activities through peer educators that conducted at TG hot zones and their living places such as pubs, bars, apartments, the beach, and parks. Interpersonal communication for TG includes HIV/AIDS knowledge and safe sex.

METHODOLOGY

This study was a second round cross-sectional survey among TG in Pattaya, Sattahip and Sriracha. This study was conducted in June 2014. The study population for this TRaC were TGs in Pattaya, Sattahip and Sriracha, aged 18-35. In order to be included in the study, TGs must have: 1) self-identified as transgender and said that they feel sexually attracted to males; 2) had more than one sexual partner (either same or different type of partner) and had penetrative sex with these partners within the past three months; 3) been living in specific area for more than one month. Time-location sampling (TLS) was used to recruit this hard-to-reach group. A structured questionnaire designed in tablet was used to collect data. A total of 300, 50 and 50 interviews were completed for Pattaya, Sattahip and Sriracha respectively. In total, 400 TGs were recruited in this study. Analyses by using UNIANOVA were used to examine trends of behaviors changes over time. Coarsened Exact Matching (CEM) was used to match treated individuals with those in a control group, based on specific covariates. The effect of treatment on outcome is the difference between treated and non-treated group.

MAIN FINDINGS

This study focused on four key behaviors; condom use, lubricant use, VCT and STI screening. The monitoring table highlights that:

- ∴ TG reported high percentage of condom use at last sex with commercial, regular commercial and casual partner (97%, 92% and 92%), while condom use at last sex with regular partner was only 69%. Consistent condom used with all type of partner was lower than condom use at last sex. Condom use behaviour varies by

- partner type. With commercial, regular commercial and casual partner, TG reported more consistent condom use than with regular partner. Consistent condom use with regular partner in the past 3 months was only 45%. Main reason for not using condom was reported about unsafe sex while drunk.
- ∴ Water-based lubricant used with regular commercial and casual partner were improved significantly over time (90% vs 99%, $p < .05$ and 76% vs 92%, $p < .01$). Condoms used along with water-based lubricant at last sex with all four types of partners were improved significantly. However, around one-third of TG (32%) still reported using oil-based lubricant because it increase sexual pleasure and easy to find.
 - ∴ More than half of TGs (54%) reported drunk in the past month did not use condom when having sex with partner.
 - ∴ More than two-thirds of TG (71%) reported ever having been tested for HIV, while 63% of them received the test in the past 12 months. Main motivation of TG who reported getting the test are worried about getting sick and died (23%). For those who never been tested for HIV, the reasons are unaware of their risk (59%) and fear of their test result (50%).
 - ∴ The proportion of TGs who have heard of 'Sisters' drop in center significantly decreased across the survey rounds of the study (80% in 2011 and 68% in 2014, $p < .001$). Moreover, the proportion of TGs who reported having been to Sisters and had been contacted by Sisters in the past 3 months, also decreased significantly.

The results of CEM evaluation analysis reveal TG who receive any service from Sisters in the past 12 months is associated with:

- ∴ HIV tested in the past 12 months (OR=5.268, $p < .001$).
- ∴ STI tested in the past 12 months (OR=2.264, $p < .001$).

PROGRAMMATIC RECOMMENDATIONS

- ∴ Promote consistent condom use with all types of partners, especially with regular partners. From research findings, condom use with commercial, regular commercial and casual partners was already high but for regular partner, there was still potential to influence change in behavior.
- ∴ Most TGs had more than one type of partners in the past month. The program was very successful in promoting condom use with commercial and regular commercial partner. These suggest program messages to focus on promoting consistent condom use with all types of partners with every sexual contact, not only with commercial partners.
- ∴ Condom use key messages should be focused on safe sex and be prepared for using condom especially before drinking alcohol.
- ∴ 71% of TG reported ever been tested for HIV. The program was effective in promoting HIV testing. TG that had contact with Sisters have over 5 times the likelihood of having been tested for HIV in the past 12 months. TG who had ever tested reported afraid of getting sick and died while those who never been tested reported unaware of their risk and fear of the test result. The program needs to promote the benefit of VCT and strengthen the perception that people who live with HIV can coexist with others, stay healthy and protect others if they know the result. Communication messages about importance of knowing HIV status in

- order to protect yourself and reducing embarrassing and stigma of getting VCT should be also promoted.
- ∴ Sisters effective in promoting HIV and STI test. However, coverage the intervention should be concerned especially in the area of Pattaya where Sister drop-in center is located. Awareness of Sisters should be improved with TG in Sattahip and Sriracha by having more outreach work.

MONITORING TABLE

Trends in behaviors, OAM behavior factors and exposure among TGs in Pattaya, Sattahip and Sriracha, 2011 and 2014

Risk: Transgenders, 18-35 years old in Pattaya, Sattahip and Sriracha

Behavior: Condom used at last sex, consistent condom used, water-based lubricant used at last sex, HIV test and STI test

- I am less likely to use condoms with a regular commercial partner	1.89	N/A	-
- Condom use with regular partner represents love and trust (SCALE) ⁴	4.46	N/A	-
Intention	Mean	Mean	
- I intend to not having sex without condom	4.56	N/A	-
- I intend to get HIV testing and counseling in the next 6 months	4.91	N/A	-
Outcome Expectation	Mean	Mean	
- Using condom reduces sexual pleasure	3.32	N/A	-
Threat	Mean	Mean	
- I am fear of the test result so I don't want to get HIV test	2.98	N/A	-
EXPOSURE	%	%	
- Awareness of Sisters	79.8	68.2	***
- Visited Sisters drop-in center in the past 12 months	32.1	17.5	***
- Has been contacted by Sisters outreach in past 12 months	61.4	33.5	***

Note:

	2011	2014
1 Among those having commercial partner	n = 309	n=264
2 Among those having regular commercial partner	n = 166	n=79
3 Among those having casual partner	n = 105	n=133
4 Among those having regular partner	n = 102	n=117
5 Among those having sex while drunk	N/A	n= 240
6 Among those having sex while high on drug	N/A	n= 29
7 Among those ever received HIV test	N/A	n= 288

OAM determinant values ranged from 1-6 "1=Strongly Disagree, 2=Disagree, 3=Mildly Disagree, 4= Mildly Agree, 5=Agree, 6=Strongly Agree"

* < .05 p-value, ** < .01 p-value, *** < .001 p-value, and NS=non-significant

Percentages and means are adjusted for age, education, occupation, nationality and income.

Attitude (Scaled Items)

Condom use with regular partner represents love and trust

- 1) I love my boyfriend so I have to protect him by using condom every time
- 2) Using condom is appropriate for people who love each other
- 3) Using condom is appropriate for people who trust each other
- 4) My regular partner still think that I trust him if I suggested using a condom
- 5) My regular partner still think that I love him if I propose using condom

ANNEX

ANNEX A: Methodology

This study was funded by the United States Agency for International Development (USAID). This study was a second round cross-sectional survey among TG in Pattaya, Sattahip and Sriracha. Cross-sectional study is a descriptive study in which disease and exposure status is measured simultaneously in this population. Cross-sectional studies can be thought of as providing a snapshot of the frequency and characteristics of a disease in a population at a particular point in time.⁴

This study was conducted in June 2014. Respondents were recruited by trained interviewers at time and location specify. The interview took around 1 hour.

1. SUBJECTS AND SAMPLING

The study population for this TRaC was TG in Pattaya, Sattahip and Sriracha, aged 18-35. In order to be included in the study, TG must have: 1) self-identified as transgender and said that they feel sexually attracted to males; 2) had more than one sexual partners and had penetrative sex with these partners within the past three months; 3) been living in specific area for more than one months.

Respondents were recruited at time and place specify in sampling frame. Fieldworkers recruited all TG who appear in each place.

Inclusion and exclusion criteria were as follow;

Inclusion criteria	Exclusion criteria
<ul style="list-style-type: none">- Age 18-35- Define themselves as transgender- Attracted to male- had more than one sexual partner and had penetrative sex with these partners within the past three months- Live in specific area for more than 1 month	<ul style="list-style-type: none">- Being a Sisters staff or peer educator- Respondent is drunk or unable to control him/herself- Participate in any research projects in the past 6 months-

Screening questions were used to assess eligibility for the study. Respondents who pass screening criteria were given self-administered questionnaire.

Time-location samplings (TLS) were used to recruit this hard-to-reach group. Every population member who appeared at the site during the fixed time interval were included in the sample. Mapped information on venues/locations for the TLS sampling frame was provided by staff at the 'Sisters' project drop-in center and verified by the PSI Thailand research. The locations listed below were all mapped locations to recruit TG to the study as follow;

⁴THE LANCET • Vol 359 • January 12, 2002 • www.thelancet.com

	Location	Day	Time	No. of TGs Recruited
Pattaya				
1	Pattaya Walking street	Mon-Thr	10 pm – 12 am	121
2	Pattaya Soi 6	Mon-Thr	8 pm – 10 pm	41

6	Tamnanchon Pub	Fri-Sun	10 pm – 12 am	11
Sattahip				
1	Vega Pub	Fri-Sun	11 pm – 1 am	31
2	Soi Sukhumvit 43	Fri-Sun	9 pm – 11 pm	13
3	Khun Thep Wedding Studio	Fri-Sun	3 pm – 7 pm	6

A total of 300, 50 and 50 interviews were completed for Pattaya, Sattahip and Sriracha respectively. In total, 400 TG were recruited in this study.

2. DATA COLLECTION INSTRUMENTS

A structured questionnaire was used to collect data for identifying factors of behavior, monitoring logframe indicators and assessing program impact. This questionnaire included modules in the following areas: population characteristics, behavior, and exposure to Sisters interventions.

Questions about sexual behaviors were asked with four types of partners as follow;

- **“Commercial partner(s)”** means partner whom you give or are given money or other valuable thing in exchange with sex
- **“Regular Commercial partner(s)”** means partner whom you give or are given money or other valuable thing in exchange with sex more than one time, you start to have emotional commitment and have chance to improve your relationship with him
- **“Casual partner(s)”** means partner whom you have sex with but no emotional commitment, or feeling for, and not give or given money or other valuable thing in exchange with sex
- **“Regular partner(s)”** means partner whom you have sex with and have emotional commitment to, or feeling for

The questionnaires were translated into Thai and pre-tested by conducting 10 interviews with TG in Bangkok. These TG were excluded from participation in the actual study. The pre-test was used to check for understandability of questions and procedures for conducting interviews. It was also be used to revise the questionnaire based on the following points: ease or difficulty of statement, comprehension, confidence in response, level of discomfort and social desirability.

3. DATA COLLECTION AND MANAGEMENT PROCEDURES

Data Collection

IPSOS (Thailand) Ltd. was hired to do the data collection. Fieldwork teams have experiences in quantitative data collection and do not have any link to Sisters staff or peer educators. PSI/Thailand Research Team was responsible for providing training to all of them. They attended one day training including background of PSI/Thailand, HIV/AIDS situation in Thailand, the purpose of the survey, the design of the questionnaire and sampling strategy, skills for recruiting and interviewing, research ethics and human subjects, potential problems and troubleshooting and data entry.

All TGs at the location during the sampling time period were approached by interview teams and peer educators assisted in transgender screening process. All those that were approached and which met the screening criteria then be read the informed consent script by interviewers. Participants were interviewed in a private place that maintains their confidentiality.

Data entry

Data entry process was done by IPSOS (Thailand) Ltd. Dataset was cleaned and checked by PSI Researcher. Data quality steps included checking the questionnaire for internal consistency (in accordance with a scrutiny note), filter errors, appropriate coding for non-response or missing values, values that fall out of range, and other logical checks. The variable for each question included in further survey rounds remained consistent. The data was laid out in a rectangular format with one record signifying one respondent. A copy of cleaned data was made available in SPSS format.

4. DATA ANALYSIS

The monitoring table track trends in behavior and related OAM indicators. It presented portray significant changes in indicators between 2011 and 2014 and produced based on ANOVA. Separate ANOVA models run for each variable of interest adjusting for socio-demographic characteristics (age, education, marital status, residence) and time.

Coarsened Exact Matching (CEM) was used to match treated individuals with those in a control group, based on specific covariates. The effect of treatment on outcome is the difference between treated and non-treated group.

5. HUMAN SUBJECTS PROTECTION

This study was approved by PSI Research Ethics Board (PSI REB) as in ANNEX B.

ANNEX B: Ethical Considerations

1120 19th Street, NW, Suite 600
Washington, DC 20036
psi.org

MEMORANDUM

DATE: April 22, 2014
TO: Duangta Pawa
FROM: PSI Research Ethics Board
RE: 18.2014
TITLE: 2nd Round HIV/AIDS TRaC Study among Transgenders in Pattaya, Sattahip and Sriracha

The PSI Research Ethics Board (PSI REB) has reviewed and approved the above referenced study via its expedited review process on April 14, 2014 for a period of 12 months. This approval will expire on April 13, 2015.

The IRB determined that study meets the criteria for expedited review under category, 45, CFR 46.110 Category 7 (*Research on individual or group characteristics or behavior (including, but not limited to, research on perception, cognition, motivation, identity, language, communication, cultural beliefs or practices, and social behavior) or research employing survey, interview, oral history, focus group, program evaluation, human factors evaluation, or quality assurance methodologies*).

The PI is required to inform the REB immediately of unanticipated problems or new information which could change the risk/benefit ratio. Modifications to study design, data collection tools, study forms, or PI staffing must be approved by the PSI REB prior to implementation. For more information concerning modification request or reporting unanticipated problems, please refer to the PSI/REB website (<http://www.psi.org/resources/research-ethics-board>) or contact Kelly O'Keefe (kokeefe@psi.org).

Sincerely,

Kelly O'Keefe
Senior Technical Advisor
Research Ethics Board
